

TRAILER & ASSET

tracking for trailers, plant machinery, and valuable asset

VISION | corporate services

GPS TRACKING SPECIFICALLY FOR TRAILERS, PLANT MACHINERY OR ANY OTHER EQUIPMENT WITH A LIMITED POWER SUPPLY

How Trailer&AssetTracker works...

Crystal Ball's Trailer&AssetTracker is GPS tracking specifically designed for trailers, plant machinery, or any other valuable asset equipment that has a limited or non-permanent power supply.

Crystal Ball's tracking units are IP67 rated, offering essential durability when fitted to assets that operate in harsh environments. Its 18 month battery life (after full charge) ensures that the trailer / asset can be traced long after it is separated from its power source.

Trailer&AssetTracker has a full reporting suite and can email alerts against specific events, including trailer movement, geofence entry/exit, or if the tracking unit's battery level is low.

Once the trailer/asset is moving, the solution acts in a similar way to standard vehicle tracking, by providing positional updates every five minutes.

How Trailer&AssetTracker can help your business...

» Security...

covertly installed tracking can follow and assist with locating and recovering stolen assets

» Movement of assets...

operates as normal vehicle tracking when the trailer or asset is on the move

» Up to 18 months battery life...

assets can be left stationary for long periods of time and still keep administrators notified of their location

Trailer&AssetTracker's real-time mapping clearly displays asset locations and status including:

- » asset speeds in journey
- » asset heading
- » battery status
- » geofence boundaries

Trailer&AssetTracker includes...

» location and journey mapping

When the trailer or asset is stationary for long periods of time, a positional update is transmitted every 24 hours and displayed on the map. Once the tracker detects movement, positional updates occur every five minutes.

» alarms and alerts

Sent via email to notify management and supervisors when trailers or assets are:

- » moved after being stationary for long periods
- » entering / exiting geofences
- » low battery life on the tracking unit

» geofences

Geofences are virtual geographic boundaries created around specified locations on Crystal Ball's mapping. They can be used to activate alerts and reports when a vehicle enters or exits the geofenced location.

» nearest to postcode

allows the administrator to determine which asset is closest to a particular postcode, ideal for customer service and logistics departments.
